Segment Polarity Gene Network

Segment Polarity Model

32 dynamic variables per cell

512 dynamic variables

16 cells per lattice

Segment Polarity Model

32 dynamic variables per cell

512 dynamic variables

16 cells per lattice

50 parameters in 12 distinct ODEs

Segment Polarity Model

32 dynamic variables per cell

512 dynamic variables

16 cells per lattice

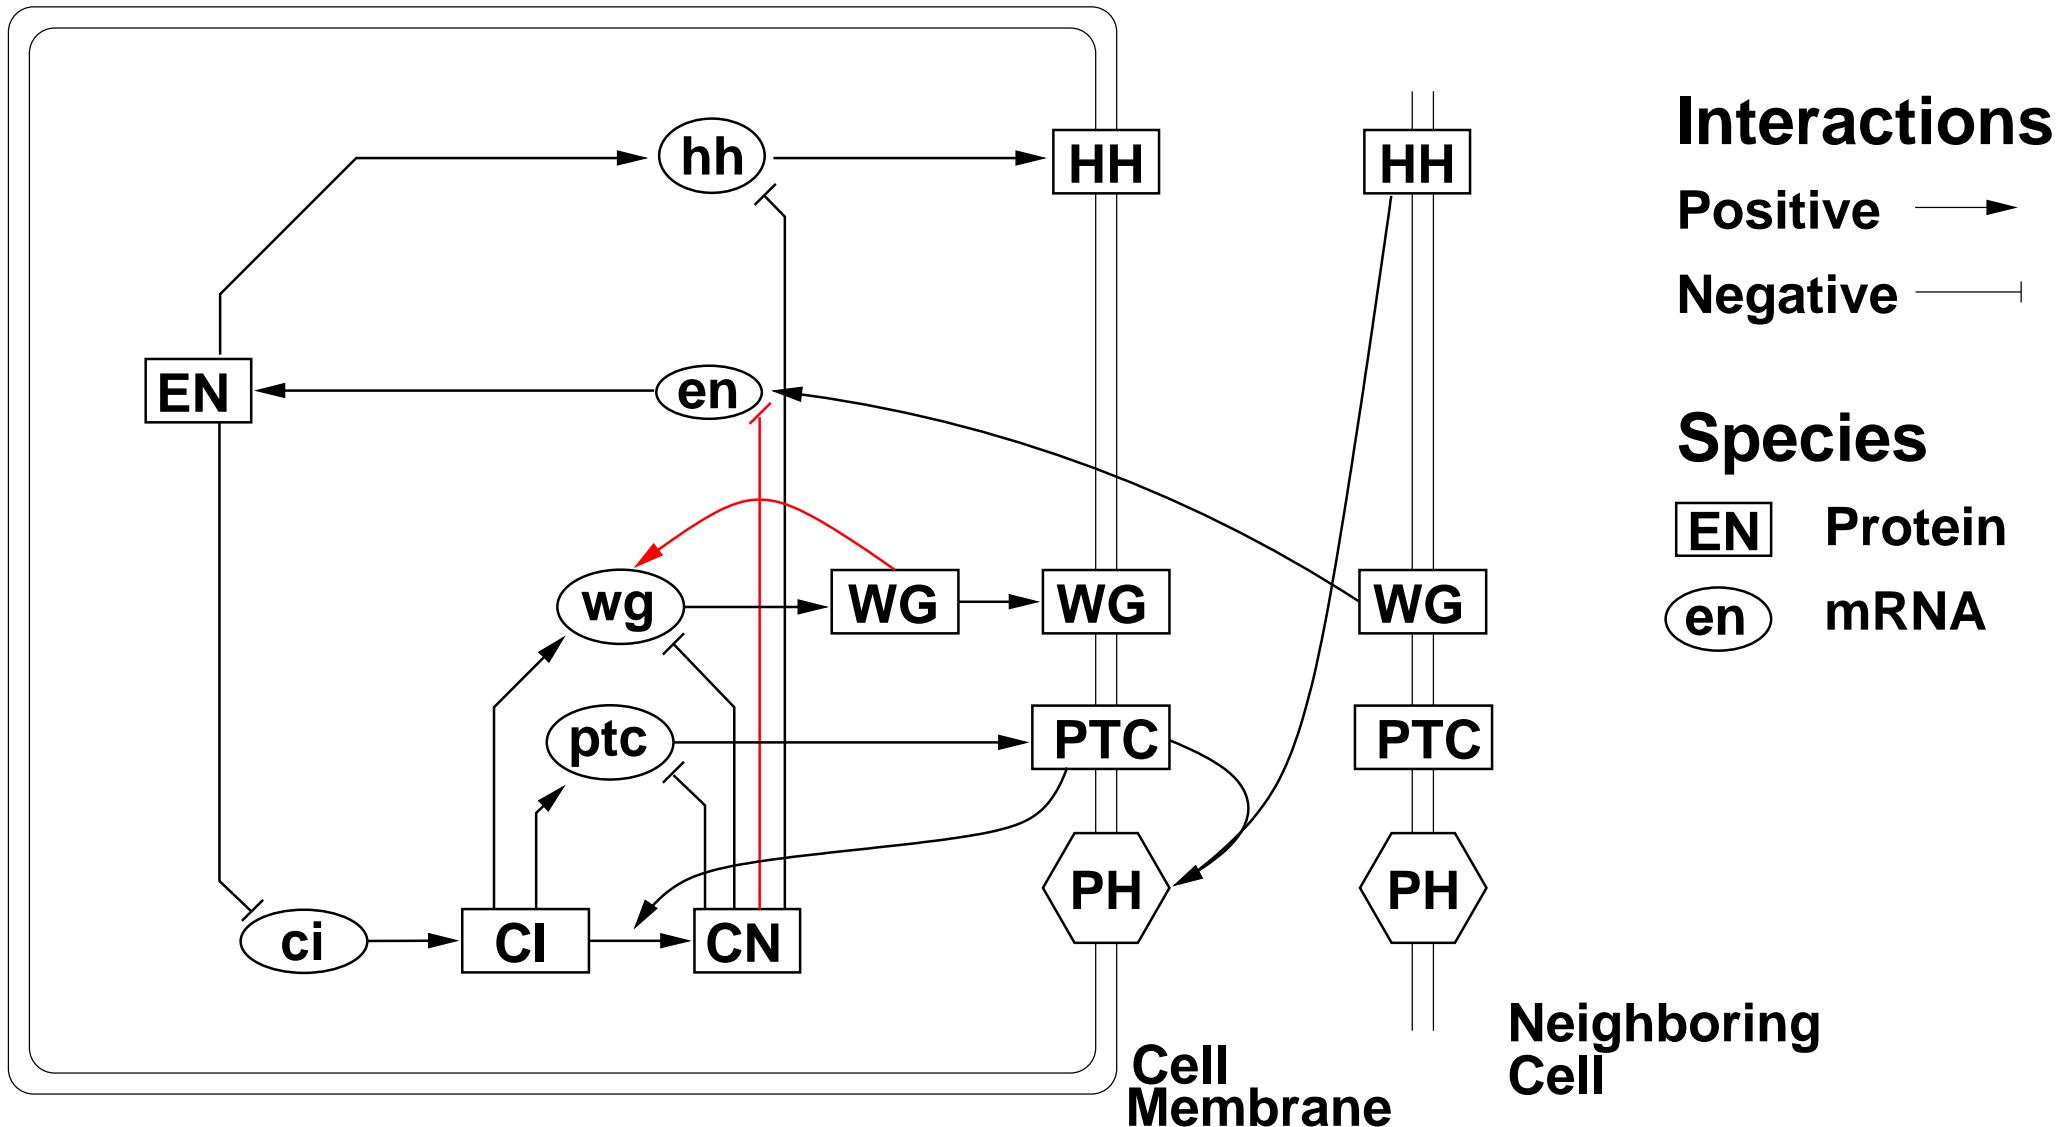

50 parameters in 12 distinct ODEs

Random parameter sets: 0.5% form the segment polarity pattern

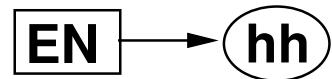

"The most striking systems-level property...is robustness"

"We originally expected the core topology to be frail and easily perturbed...the simplest model...emerged complete with unexpected robustness"

Segment Polarity Gene Network

Segment Polarity Model Equations

$$\frac{dhh}{dt} = \frac{1}{\tau_{hh}} \left(-hh + \frac{EN^v}{K^v + EN^v} \right)$$

$$\frac{dHH}{dt} = \frac{1}{\tau_{HH}} \left(-HH + hh \right)$$

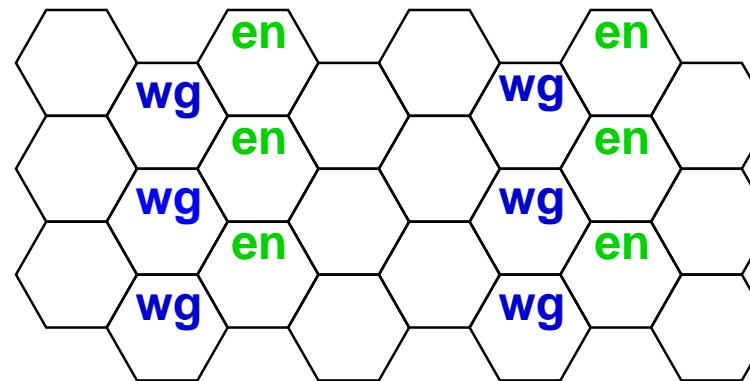

τ_{hh} Time constant of hh degradation

K "Affinity" of EN: level needed for half-maximal response

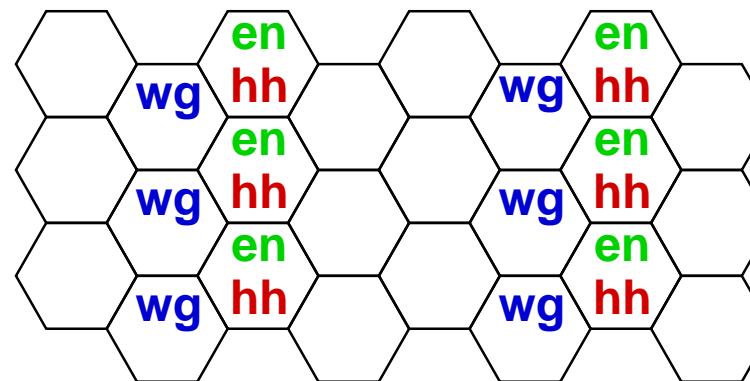

v Cooperativity
