

# **Genetic context dependence diversifies evolving microbial populations**

Susanna K. Remold  
Department of Biology  
University of Louisville

***Simplifying assumptions of many studies of the effects of genes:***

---

- assume each locus has one function
- assume each locus exists as one allele
- assume few components of the environment affect a given locus

# *Context dependence*

- *What is it?*
- *How common is it?*
- *How does it arise evolutionarily?*
- *What are its consequences?*

# Types of context-dependence

**1) Genetic epistasis:**  
effect of allele at locus C depends on allele at locus B

$BxCx$  black  
 $bbCx$  brown  
 $xxcc$  white

# Types of context-dependence

## 2) Phenotypic plasticity:

effect of allele depends on the environment

*Daphnia cucullata* develop defensive helmets only in response to predation stimulus

# Types of context-dependence

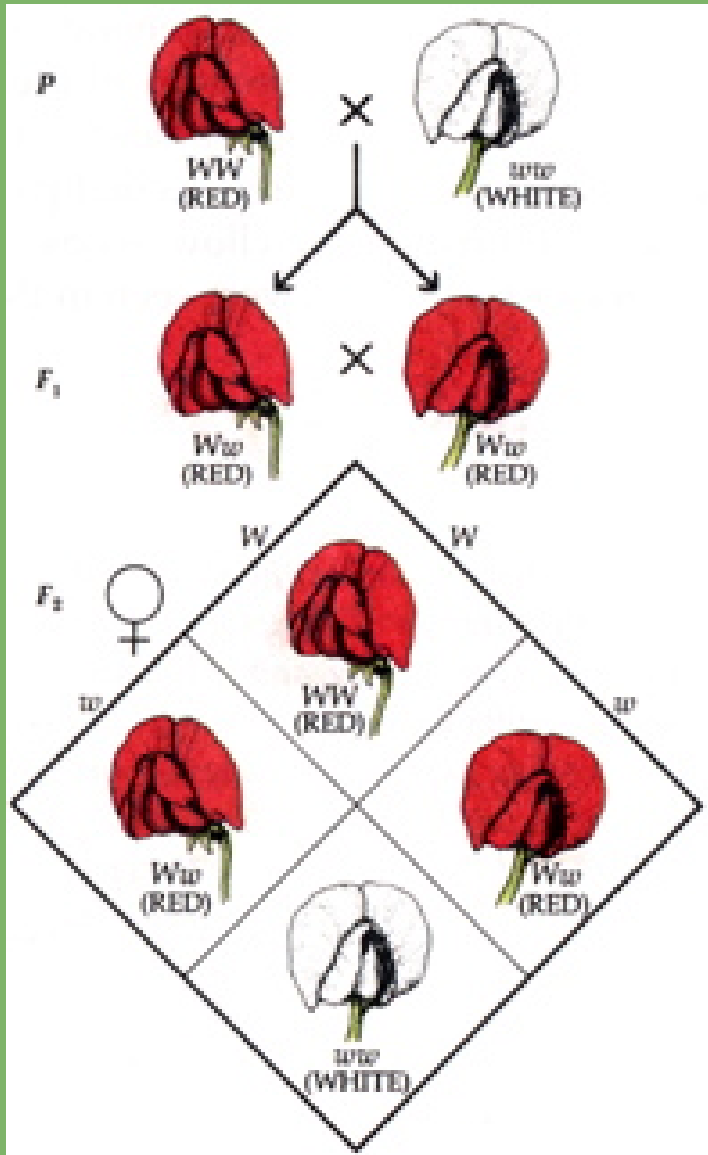

## 3) Pleiotropy: Locus affects multiple traits

(function depends on  
*developmental* or  
*environmental* context)

*The signaling molecule brain derived neurotrophic factor (BDNF) triggers different processes depending on the cell type to which it binds*

# Types of context-dependence

## 4) Dominance:

effect of allele depends on other allele at same locus

(a special case of epistasis)

# *Types of context-dependence*

## **5) Various higher order interactions:**

gene x gene x environment

gene x environment x environment

gene x gene x environment x environment

***1-5 are variations on a single theme.***

# Types of context-dependence

**Individual** vs. **population** level interactions:

(J. Moore 2005 Nature Genetics 37:13)

# ***Context-dependence and Genetic architecture***

---

- (Average) effects of important genes
- Their genomic positions
- Number of genes
- Individual context dependence
- Contributions population level context dependence to genetic variance

***How common  
is context  
dependence?***

# ***How common is context-dependence?***

---

- ***Do different ecological parameters cause the same amount of dependence in the effects of alleles?***

# *Genotypes:*

Mutants differ from progenitor at single, randomly located genes

# Genotypes:

***What are the  
consequences  
of context  
dependence?***

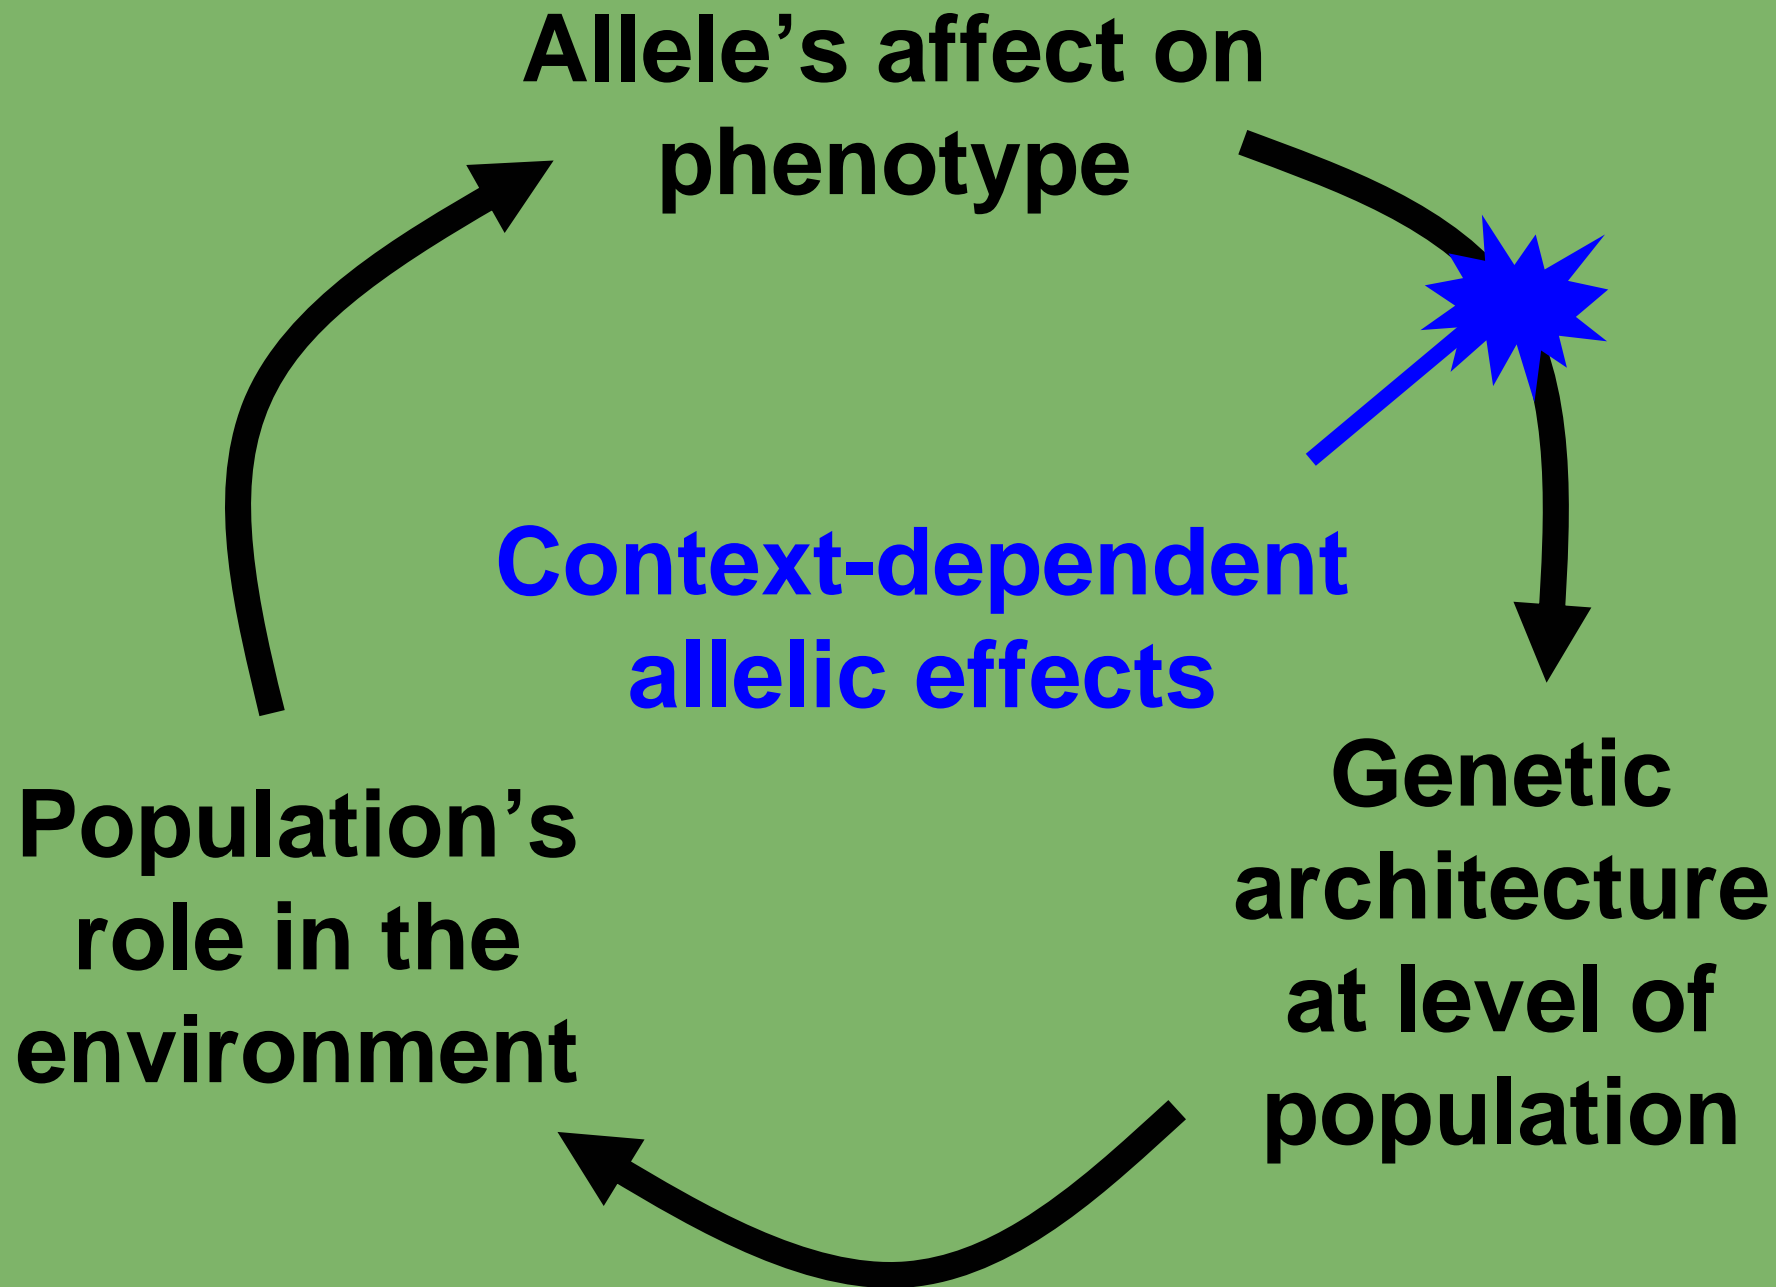

**Allele's affect on  
phenotype**

**Genetic  
architecture  
at level of  
population**

**Population's  
role in the  
environment**

Phage  $\phi 6$  of *Pseudomonas phaseolicola*

***How will co-infection and epistasis affect the rate of loss of deleterious alleles?***

***Replicate mixed populations infect hosts at **low** and **high** multiplicity of infection.***

## **Sex:**

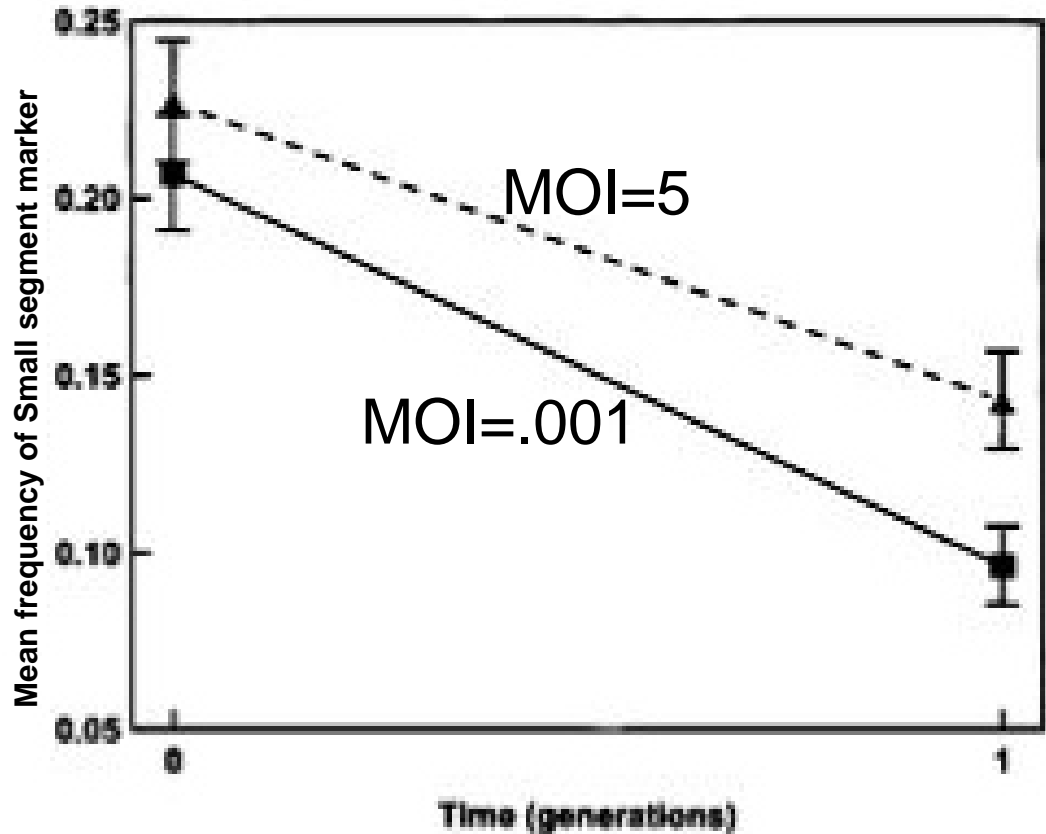

*Reassortment of synergistically epistatic mutations could speed their elimination from the population*

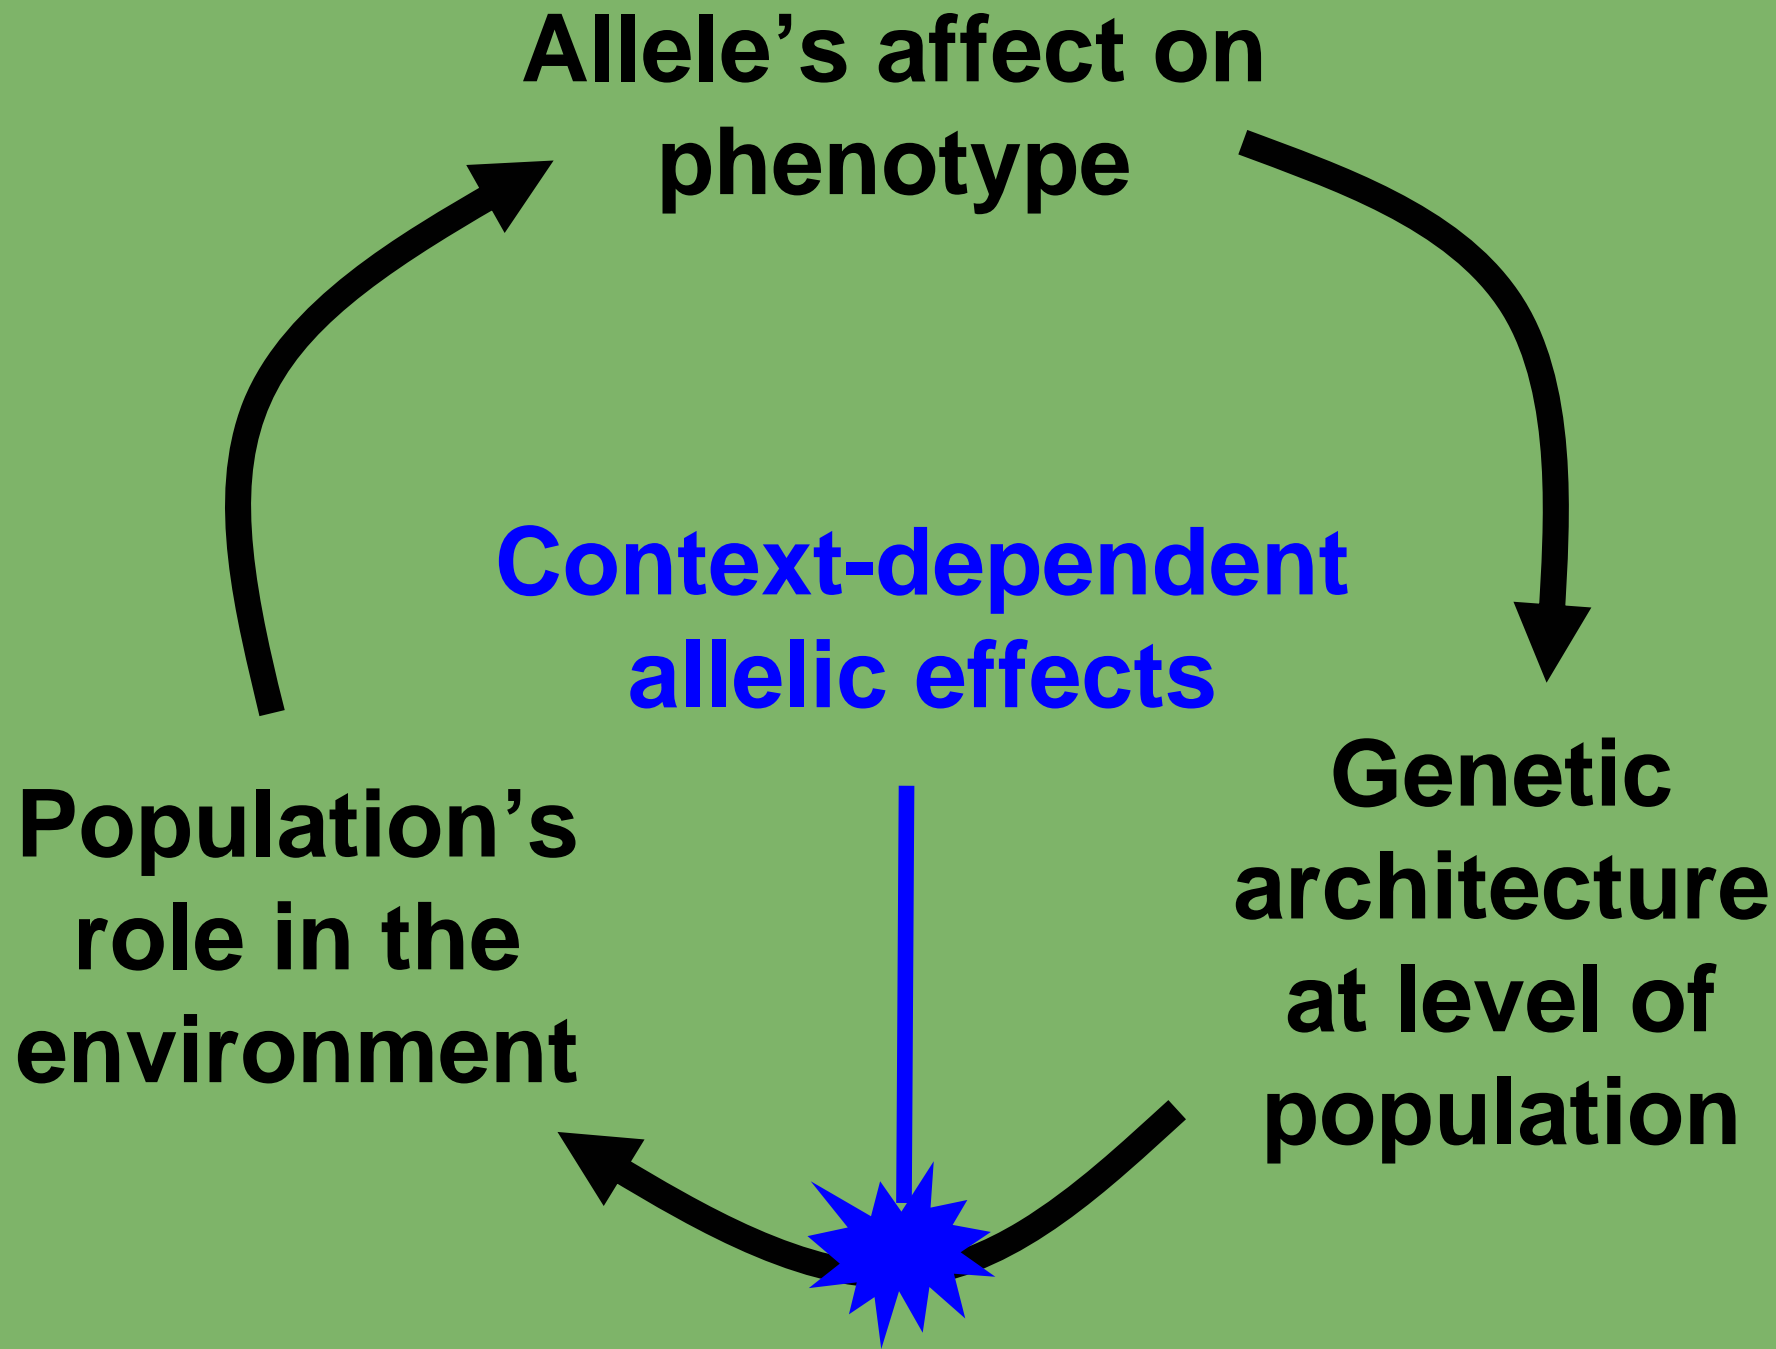

## **Complementation:**

*Presence of the WT gene product due to co-infection could decrease the mutation's cost and slow its elimination*

Stronger selection against the mutation in the absence of co-infection than in its presence.

***In this case, complementation is stronger than sex.***

# ***Context dependence***

---

- Broadly speaking, context dependence occurs when the effect of an allele on other factor(s).
- May be very common, and higher order interactions may be most common.
- Both contingency and selection can contribute to the evolution of context dependence.
- Context dependence can increase diversity among populations and can affect the probability of colonization of new niches.
