## Questions

Can we visualize the dynamics of QED interactions with space-time resolution?

Relationship between virtual and real particles?

Dynamics of virtual particles?

Is this picture correct?

Peskin Schroeder Fig. 7.8

, Greiner Fig. 1.3a

## Quantum mechanics:

(1) know: $\phi(\mathrm{x}, \mathrm{t}=0)$ and $\mathrm{h}(\mathrm{t})$
(2) solve: $i \partial_{t} \phi(x, t)=h(t) \phi(x, t) \quad$ for the initial state ONLY (3) compute: observables $\langle\phi(\mathrm{t})| \mathrm{O}|\phi(\mathrm{t})\rangle$

## Quantum field theory:

(1) know: $|\Phi(\mathrm{t}=0)\rangle$ and $\mathrm{H}(\mathrm{t})$
(2) solve: $i \partial_{t} \phi_{E}(x, t)=H(t) \quad \phi_{E}(x, t) \quad$ for $\mathbf{E A C H}$ state $\phi_{E}(x)$ of ENTIRE Hilbert space
(3) compute: observables $\langle\Phi(\mathrm{t}=0)| \mathrm{O}\left(\right.$ all $\left.\phi_{\mathrm{E}}(\mathrm{x}, \mathrm{t})\right)|\Phi(\mathrm{t}=0)\rangle$

## Charge

## density $\rho(\mathrm{z}, \mathrm{t})$

$$
\rho(\mathrm{z}, \mathrm{t})=\langle\Phi(\mathrm{t}=0)|-\left[\Psi^{\dagger}(\mathrm{z}, \mathrm{t}), \Psi(\mathrm{z}, \mathrm{t})\right] / 2|\Phi(\mathrm{t}=0)\rangle
$$

example: single electron

$$
|\Phi(\mathrm{t}=0)\rangle=\mathrm{b}_{\mathrm{P}}^{\dagger}|\mathrm{vac}\rangle
$$

$$
\rho(\mathrm{z}, \mathrm{t})=-\left|\phi_{\mathrm{P}}(+; \mathrm{z}, \mathrm{t})\right|^{2}+\left(\Sigma_{\mathrm{E}(+)}\left|\phi_{\mathrm{E}}(+; \mathrm{z}, \mathrm{t})\right|^{2}-\Sigma_{\mathrm{E}(-)}\left|\phi_{\mathrm{E}}(-; \mathrm{z}, \mathrm{t})\right|^{2}\right) / 2
$$

electron's wave function (trivial)
vacuum's polarization density
(not understood)
$\mathrm{t}=0: \quad \mathrm{h}_{0} \phi_{\mathrm{E}}=\mathrm{E} \phi_{\mathrm{E}}$
$\mathrm{t}>0: \quad \mathrm{i} \partial_{\mathrm{t}} \phi_{\mathrm{E}}(\mathrm{t})=\mathrm{h} \quad \phi_{\mathrm{E}}(\mathrm{t})$

$$
\phi_{\mathrm{E}}(-)-\mathrm{mc}^{2} \quad \mathrm{mc}^{2}
$$

$$
\phi_{\mathrm{E}}(+)
$$

## Quick overview

(1) Computational approach

- Steady state vacuum polarization $\rho(z)$
- Space-time evolution of $\rho(z, t)$
- Steady state and time averaged dynamics
(2) Analytical approaches
- Phenomenological model
- Decoupled Hamiltonians
- Perturbation theory
(3) Applications
- Coupling $\rho$ to Maxwell equation
- Relevance for pair-creation process
- Relationship to traditional work

## 2. Example: $\quad \rho(\mathbf{z})$ for the dressed vacuum state |VAC $\rangle$

$$
\rho_{\mathrm{pol}}(\mathrm{z})=\langle\mathrm{VAC}|-\left[\Psi^{\dagger}(\mathrm{z}), \Psi(\mathrm{z})\right] / 2|\mathrm{VAC}\rangle
$$

Dirac equation

$$
\left[\mathrm{c} \sigma_{1} \mathrm{p}_{\mathrm{z}}+\mathrm{mc}^{2} \sigma_{3}+\mathrm{V}_{\mathrm{ext}}(\mathrm{z})\right] \Phi_{\mathrm{E}}(\mathrm{z})=\mathrm{E} \Phi_{\mathrm{E}}(\mathrm{z})
$$

$$
\rho_{\mathrm{pol}}(\mathrm{z})=\left(\sum_{\mathrm{E}(+)}\left|\Phi_{\mathrm{E}}(+; \mathrm{z})\right|^{2}-\sum_{\mathrm{E}(-)}\left|\Phi_{\mathrm{E}}(-; \mathrm{z})\right|^{2}\right) / 2
$$

## Width w of external potential $\mathbf{V}_{\text {ext }}(\mathrm{z})$ determines $\rho(\mathrm{z})$

$$
\mathrm{V}_{\mathrm{ext}}(\mathrm{z})=\mathrm{V}_{0} \exp \left[-(\mathrm{z} / \mathrm{w})^{2}\right]
$$

## 3. Example: Dynamics of the polarization density

$$
\left.\rho_{\mathrm{pol}}(\mathrm{z}, \mathrm{t})=\langle\text { bare vac }|-[\Psi \dagger(\mathrm{z}, \mathrm{t}), \Psi(\mathrm{z}, \mathrm{t})] / 2 \mid \text { bare vac }\right\rangle
$$

$$
\rho_{\mathrm{pol}}(\mathrm{z}, \mathrm{t})=\left(\sum_{\mathrm{E}(+)}\left|\phi_{\mathrm{E}}(+; \mathrm{z}, \mathrm{t})\right|^{2}-\sum_{\mathrm{E}(-)}\left|\phi_{\mathrm{E}}(-; \mathrm{z}, \mathrm{t})\right|^{2}\right) / 2
$$

$\phi_{\mathrm{E}}(-) \mathrm{mc}^{2} \mathrm{mc}^{2} \quad \phi_{\mathrm{E}}(+)$
time-dependent Dirac equation:
$\mathrm{i} \hbar \partial_{\mathrm{t}} \phi_{\mathrm{E}}(\mathrm{z}, \mathrm{t})=\left[\mathrm{c} \sigma_{3} \mathrm{p}_{\mathrm{z}}+\mathrm{mc}^{2} \sigma_{3}+\mathrm{V}(\mathrm{z})\right] \phi_{\mathrm{E}}(\mathrm{z}, \mathrm{t})$

## Temporal evolution of $\rho(\mathbf{x}, \mathbf{t})$

$$
V_{\text {ext }}(x) \quad l \quad \rho_{\text {poi }}(x, t)
$$

$$
\rho_{\text {steady }}(\mathrm{x})=\mathrm{T}^{-1} \int \mathrm{~T} \mathrm{dt} \rho(\mathrm{x}, \mathrm{t})
$$

$\mathrm{t}=0.000145947$

## Quick overview

(1) Computational approach

- Steady state vacuum polarization $\rho(z)$
- Space-time evolution of $\rho(\mathrm{z}, \mathrm{t})$
- Steady state and time averaged dynamics
(2) Analytical approaches
- Phenomenological model
- Decoupled Hamiltonians
- Perturbation theory
(3) Applications
- Coupling $\rho$ to Maxwell equation
- Relevance for pair-creation process
- Relationship to traditional work

Maxwell
$\mathrm{q}_{\text {ext }}(\mathrm{z}) \quad\left(\quad \mathrm{V}_{\text {ext }}(\mathrm{z})\right.$
Dirac

## Phenomenological model for $\rho_{\mathrm{pol}}(\mathrm{z}, \mathrm{t})$

$$
\left.\left(\partial_{\mathrm{ct}}^{2}-\partial_{\mathrm{z}}^{2}\right) \rho_{\mathrm{pol}}(\mathrm{z}, \mathrm{t})=8 \pi \chi \mathrm{q}_{\mathrm{ext}}(\mathrm{z}) \quad \chi=\alpha^{3} /\left(2 \pi \lambda_{\mathrm{C}}^{2}\right) \text { (guess }\right)
$$

## exact solution:

$$
\begin{aligned}
\rho_{\mathrm{pol}}(\mathrm{z}, \mathrm{t}) & =\chi\left[2 \mathrm{~V}_{\mathrm{ext}}(\mathrm{z})-\mathrm{V}_{\mathrm{ext}}(\mathrm{z}-\mathrm{ct})-\mathrm{V}_{\mathrm{ext}}(\mathrm{z}+\mathrm{ct})\right] \\
\mathrm{j}_{\mathrm{pol}}(\mathrm{z}, \mathrm{t}) & =\chi \mathrm{c}\left[\mathrm{~V}_{\mathrm{ext}}(\mathrm{z}+\mathrm{ct})-\mathrm{V}_{\mathrm{ext}}(\mathrm{z}-\mathrm{ct})\right]
\end{aligned}
$$

if width of $\mathrm{V}_{\text {ext }}>\lambda_{\mathrm{C}} \Rightarrow>$ predictions for $\rho_{\text {pol }}(\mathrm{z}, \mathrm{t})$ are highly accurate
$\rho_{\mathrm{pol}}(\mathrm{z}, \mathrm{t})$ and $\mathrm{j}_{\mathrm{pol}}(\mathrm{z}, \mathrm{t})$ for an external

$$
\rho(\mathrm{z}, \mathrm{t})=\chi[2 \mathrm{~V}(\mathrm{z})-\mathrm{V}(\mathrm{z}-\mathrm{ct})-\mathrm{V}(\mathrm{z}+\mathrm{ct})]
$$

## point charge +

$$
\begin{aligned}
& \mathrm{q}_{\mathrm{ext}}(\mathrm{z})=\mathrm{q} \delta(\mathrm{z}) \\
& \mathrm{V}_{\mathrm{ext}}(\mathrm{z})=-2 \pi \mathrm{q}|\mathrm{z}|
\end{aligned}
$$

$\rho_{\text {pol }}(z, t)$

- charge conservation $\checkmark$
- $\lim _{\mathrm{L}, \mathrm{t} \rightarrow \infty} \rho(\mathrm{z}=0, \mathrm{t}) \rightarrow \infty \boldsymbol{\checkmark}$

$$
\mathrm{j}(\mathrm{z}, \mathrm{t})=\chi \mathrm{c}[\mathrm{~V}(\mathrm{z}+\mathrm{ct})-\mathrm{V}(\mathrm{z}-\mathrm{ct})]
$$

## Decoupled Hamiltonian model

$$
\begin{array}{ll}
\mathrm{H}(+)=\left[\mathrm{m}^{2} \mathrm{c}^{4}+\mathrm{c}^{2} \mathrm{p}^{2}\right]^{1 / 2}+\mathrm{V}_{\mathrm{ext}}(\mathrm{z}) & \Rightarrow \text { bound states } \\
\mathrm{H}(-)=\left[\mathrm{m}^{2} \mathrm{c}^{4}+\mathrm{c}^{2} \mathrm{p}^{2}\right]^{1 / 2}-\mathrm{V}_{\mathrm{ext}}(\mathrm{z}) & \Rightarrow \text { scattering states } \\
& \\
\rho_{\mathrm{pol}}(\mathrm{z}, \mathrm{t})=\left(\sum_{\mathrm{E}(+)}\left|\phi_{\mathrm{E}}(+; \mathrm{z}, \mathrm{t})\right|^{2}-\sum_{\mathrm{E}(-)}\left|\phi_{\mathrm{E}}(-; \mathrm{z}, \mathrm{t})\right|^{2}\right) / 2
\end{array}
$$

predictions for $\rho_{\text {pol }}(z, t)$ are highly accurate
=> transitions between positive and negative Dirac states irrelevant

## Traditional perturbation theory

$$
\begin{aligned}
& \left|\Psi_{\mathrm{E}}^{(1)}\right\rangle=\left|\phi_{\mathrm{E}}\right\rangle+\Sigma_{\mathrm{E}},\left\langle\phi_{\mathrm{E} \square}\right| \mathrm{V}_{\mathrm{ext}}\left|\phi_{\mathrm{E} \square}\right\rangle /\left(\mathrm{E}_{\mathrm{E}} \mathrm{E}^{\prime}\right)\left|\phi_{\mathrm{E} \square}\right\rangle+\ldots \\
& \left|\Psi_{\mathrm{E}}^{(1)}\right\rangle=\left|\phi_{\mathrm{E}}\right\rangle-\Sigma_{\mathrm{E}},\left\langle\phi_{\mathrm{E} \square}\right| \mathrm{V}_{\mathrm{ext}}\left|\phi_{\mathrm{E} \square}\right\rangle /\left(\mathrm{E}-\mathrm{E}^{\prime}\right)\left|\phi_{\mathrm{E} \square}\right\rangle+\ldots
\end{aligned}
$$

$$
\rho_{\mathrm{pol}}(\mathrm{z}, \mathrm{t})=\left(\sum_{\mathrm{E}}\left|\Psi_{\mathrm{E}}^{(1)}(\mathrm{z})\right|^{2}-\sum_{\mathrm{E}}\left|\Psi_{\mathrm{E}}^{(1)}(\mathrm{z})\right|^{2}\right) / 2
$$

predictions for $\rho_{\mathrm{pol}}(\mathrm{z}, \mathrm{t})$ are highly accurate
$=>$ perturbative approach applicable also to 2 and 3D ?

## Intermediate summary

$$
\left(\partial_{\mathrm{ct}}^{2}-\partial_{\mathrm{z}}^{2}\right) \rho_{\mathrm{pol}}(\mathrm{z}, \mathrm{t})=8 \pi \chi \mathrm{q}_{\mathrm{ext}}(\mathrm{z}) \quad \text { with } \quad \chi=\alpha^{3} /\left(2 \pi \lambda_{\mathrm{C}}^{2}\right)
$$

4 independent approaches:
(steady, dynamics, phenom, decoupled hamiltonian) predict:

## massless virtual positive particles accumulate around positive charges

=> Is the energy conserved?
=> What if real particles are created in addition?
=> Consistent with traditional QED methods?

## Quick overview

(1) Computational approach

- Steady state vacuum polarization $\rho(z)$
- Space-time evolution of $\rho(\mathrm{z}, \mathrm{t})$
- Steady state and time averaged dynamics
(2) Analytical approaches
- Phenomenological model
- Decoupled Hamiltonians
- Perturbation theory
(3) Applications
- Coupling $\rho$ to Maxwell equation
- Relevance for pair-creation process
- Relationship to traditional work

## Coupled Dirac-Maxwell equation

$$
\rho_{\mathrm{pol}}(\mathrm{z}, \mathrm{t})=\left(\sum_{\mathrm{E}(+)}\left|\phi_{\mathrm{E}}(+; \mathrm{z}, \mathrm{t})\right|^{2}-\sum_{\mathrm{E}(-)}\left|\phi_{\mathrm{E}}(-; \mathrm{z}, \mathrm{t})\right|^{2}\right) / 2
$$

## Dirac equation:

$$
\mathrm{i} \partial_{\mathrm{t}} \phi_{\mathrm{E}}(\mathrm{z}, \mathrm{t})=\left[\mathrm{c} \sigma_{1}\left[\mathrm{p}_{\mathrm{z}}-\mathrm{A}(\mathrm{z}, \mathrm{t}) / \mathrm{c}\right]+\mathrm{mc}^{2} \sigma_{3}+\mathrm{V}(\mathrm{z}, \mathrm{t})\right] \phi_{\mathrm{E}}(\mathrm{z}, \mathrm{t})
$$

Maxwell equation:

$$
\begin{aligned}
& {\left[\partial_{\mathrm{ct}}^{2}-\partial_{\mathrm{z}}^{2}\right] \mathrm{V}(\mathrm{z}, \mathrm{t})=4 \pi \rho(\mathrm{z}, \mathrm{t})} \\
& {\left[\partial_{\mathrm{ct}}^{2}-\partial_{\mathrm{z}}^{2}\right] \mathrm{A}(\mathrm{z}, \mathrm{t})=4 \pi \mathrm{j}(\mathrm{z}, \mathrm{t}) / \mathrm{c}}
\end{aligned}
$$

## Energy conservation

$$
E_{\text {tot }}=E_{\text {mat }}(t)+E_{\text {int }}(t)+E_{\text {field }}(t)
$$

$$
\begin{aligned}
& \mathrm{E}_{\text {mat }}(\mathrm{t})=\int \mathrm{dz}\left\langle\Psi^{\dagger}(\mathrm{z}, \mathrm{t})\left\{\mathrm{c} \sigma_{1} \mathrm{p}+\sigma_{3} \mathrm{mc}^{2}\right\} \Psi(\mathrm{z}, \mathrm{t})\right\rangle \\
& \mathrm{E}_{\text {int }}(\mathrm{t})=\mathrm{q} \int \mathrm{dz}\left\langle\Psi^{\dagger}(\mathrm{z}, \mathrm{t})\left\{\mathrm{V}(\mathrm{z}, \mathrm{t})-\sigma_{1} \mathrm{~A}(\mathrm{z}, \mathrm{t})\right\} \Psi(\mathrm{z}, \mathrm{t})\right\rangle \\
& \mathrm{E}_{\text {field }}(\mathrm{t})=(8 \pi)^{-1} \int \mathrm{dz}\left\{\left[\partial_{\mathrm{ct}} \mathrm{~A}(\mathrm{z}, \mathrm{t})\right]^{2}-\left[\partial_{\mathrm{z}} \mathrm{~V}(\mathrm{z}, \mathrm{t})\right]^{2}\right\}
\end{aligned}
$$

Temporal gauge:
$\mathrm{E}_{\text {int }}(\mathrm{t})=-\mathrm{q} \int \mathrm{dz}\left\langle\Psi^{\dagger}(\mathrm{z}, \mathrm{t}) \sigma_{1} \mathrm{~A}(\mathrm{z}, \mathrm{t}) \Psi(\mathrm{z}, \mathrm{t})\right\rangle$
$\mathrm{E}_{\text {field }}(\mathrm{t})=(8 \pi)^{-1} \int \mathrm{dz} \mathrm{E}^{2}(\mathrm{z}, \mathrm{t})$

## Energy is conserved despite $\mathbf{q}_{\text {pol }} \rightarrow \infty$

## Pair creation regime: $\rho_{\mathrm{pol}}=\rho_{\mathrm{vac}}+\rho_{\mathrm{e}-\mathrm{e}+}$

real particles reduce the total charge density induced and real particles obey opposite "force laws"

## More quantitatively: mass density of real particles

$$
\Psi(\mathrm{z}, \mathrm{t}) \equiv \Psi\left(\mathrm{e}^{-}\right)+\mathrm{C} \Psi\left(\mathrm{e}^{+}\right)
$$

effective charge density

$$
\begin{aligned}
\mathrm{m}\left(\mathrm{e}^{-} ; \mathrm{z}, \mathrm{t}\right) & \equiv\langle\operatorname{vac}| \Psi^{\dagger}\left(\mathrm{e}^{-}\right) \Psi\left(\mathrm{e}^{-}\right)|\mathrm{vac}\rangle \\
\mathrm{m}\left(\mathrm{e}^{+} ; \mathrm{z}, \mathrm{t}\right) & \equiv\langle\operatorname{vac}| \Psi^{\dagger}\left(\mathrm{e}^{+}\right) \Psi\left(\mathrm{e}^{+}\right)|\mathrm{vac}\rangle
\end{aligned}
$$

$$
\begin{gathered}
\stackrel{\rho_{\mathrm{eff}}(\mathrm{z})}{\equiv} \\
\mathrm{m}\left(\mathrm{e}^{+} ; \mathrm{z}\right)-\mathrm{m}\left(\mathrm{e}^{-} ; \mathrm{z}\right)
\end{gathered}
$$

## Traditional pert. QED approach:

$$
\mathrm{q}_{\mathrm{ext}}(\mathbf{r})=\mathrm{e} \delta(\mathrm{z})
$$

Peskin-Schroeder Eq. 7.93

$$
\Pi_{2}=4 \alpha\left[\mathrm{k}^{-2}-4 \mathrm{c}^{4} \mathrm{k}^{-3}\left(4 \mathrm{c}^{4}-\mathrm{k}^{2}\right)^{-1 / 2} \arctan \left[\mathrm{k}\left(4 \mathrm{c}^{4}-\mathrm{k}^{2}\right)^{-1 / 2}\right]\right]
$$

necessary: regularization ( $\mathrm{P}-\mathrm{V}$ or dim.) and charge renormalization

$$
\begin{aligned}
& \mathrm{E}_{\mathrm{int}}(\mathrm{z})=(2 \pi)^{-1} \int \mathrm{dk} \exp (\mathrm{ikz}) \mathrm{e}^{2} \mathrm{k}^{-2}\left[1-\Pi_{2}\right]^{-1} \\
& \cong \underbrace{-2 \pi \mathrm{e}^{2}|\mathrm{z}|}_{\text {Coulomb }} \\
& \underbrace{-\alpha \mathbf{e}^{2} 4 \pi / 3|\mathbf{z}|^{3}}_{\text {vac. pol. correction }}+\ldots
\end{aligned}
$$

## Traditional pert. QED approach:

$$
\mathrm{E}_{\mathrm{int}}(\mathrm{z}) \cong \underbrace{-2 \pi \mathrm{e}^{2}|\mathrm{z}|}_{\text {Coulomb }} \underbrace{-\alpha \mathrm{e}^{2} 4 \pi / 3|\mathbf{z}|^{3}}_{\text {vac. pol. correction }}+\ldots
$$

## Possible connection to our approach:

$$
\begin{aligned}
& -\partial_{\mathrm{z}}^{2} \mathrm{~V}_{\mathrm{ext}}(\mathrm{z})=4 \pi \mathrm{q}_{\text {ext }}(\mathrm{z})
\end{aligned}
$$

$$
\begin{aligned}
& +\partial_{\mathrm{z}}^{2} \mathrm{~V}_{\mathrm{pol}}(\mathrm{z})=4 \pi \rho_{\mathrm{pol}}(\mathrm{z}) \quad \Rightarrow \mathrm{V}_{\mathrm{pol}}(\mathrm{z})=-8 \pi^{2} / 3 \mathrm{e} \chi|\mathrm{z}|^{3} \\
& =-\alpha \mathbf{e} 4 \pi / 3|z|^{3}
\end{aligned}
$$

regularization and charge renormalization NOT necessary
(Too) many open questions....
$\odot q_{\text {ext }}(z)=\delta(z)=>$ infinite plane: $\lim _{t \rightarrow \infty} \rho(z, t) \rightarrow \infty$
$\bigcirc 1 D \neq 3 \mathrm{D}$ with spatial symmetry (relativity)
$\odot$ implications for 2D and 3D: $\square \rho_{\mathrm{pol}}=8 \pi \chi \mathrm{q}_{\mathrm{ext}}(\mathrm{r})$ ??
$\bigcirc$ more contact with traditional methods
$\bigcirc$ experimental implications

## Conceptual problems in QED

## Part I: Polarization density of the vacuum $($ photon $=$ classical field $)$

Part II: Bare, physical particles, renormalization
(photon = independent particle )

## 5 drawbacks of the $S$ matrix

(1) $\mathrm{T} \rightarrow \infty$ is built in
(2) $d \sigma / d \omega$ is rate based
(3) usually only perturbative
(4) no spatial information
(5) black box approach

What happens inside the interaction zone?

The challenge:

## study QED interactions with space-time resolution

$\odot$ construct Hamiltonian H
$\odot$ evolve $|\Psi(\mathrm{t}=0)\rangle$ to $|\Psi(\mathrm{t})\rangle$

$$
\text { by solving } \mathrm{i} \square / \mathrm{t}|\Psi(\mathrm{t})\rangle=\mathrm{H}|\Psi(\mathrm{t})\rangle
$$

$\odot$ convert $|\Psi(\mathrm{t})\rangle$ into observables

The problems:
© Hilbert space is gigantic
© Hamiltonian is "wrong" and requires serious repair
(ब) correct physical operators are unknown

## Electron - positron - photon interactions

$$
\begin{gathered}
\mathrm{b}_{\mathrm{p}}^{\square} \\
\mathrm{H}_{0}=\Sigma+\mathrm{dp} \mathrm{E}_{\mathrm{p}} \mathrm{~b}_{\mathrm{p}}^{\square} \mathrm{b}_{\mathrm{p}}+\Sigma+\mathrm{dp} \mathrm{E}_{\mathrm{p}} \mathrm{~d}_{\mathrm{p}} \square \mathrm{~d}_{\mathrm{p}}+\Sigma+\mathrm{dp} \omega_{\mathrm{p}} \\
\mathrm{a}_{\mathrm{p}}^{\square} \mathrm{a}_{\mathrm{p}}
\end{gathered} \quad \begin{aligned}
& \mathrm{a}_{\mathrm{p}} \\
& \mathrm{H}_{\text {int }}=\Sigma++\mathrm{dp} \mathrm{dk} \ldots . \quad 8 \text { basic "processes" }
\end{aligned}
$$

Photon annihilation: $\underset{\sim}{\mathrm{b}} \underset{\mathrm{ba}}{\mathrm{ba}}$

Photon creation:

## Three Hamiltonians of quantum field theory

$$
\begin{aligned}
H_{\text {bare }}= & b-b+a \square a+b \square a+\ldots \\
& \odot \text { wrong energies } \\
& \odot \text { bad operators } H \text { b }\lceil 0\rangle \neq E b\lceil 0\rangle
\end{aligned}
$$

$$
\begin{aligned}
\mathrm{H}_{\text {renorm }}= & \mathrm{b} \\
& \odot \text { b correct energies } \checkmark \\
& \odot \text { bad operators }
\end{aligned}
$$

$\mathrm{H}_{\text {dressed }}=\mathrm{B} \mathrm{B}+\mathrm{A} \mathrm{A}+\mathrm{B} \mathrm{B}^{\square} \mathrm{BB}+\ldots ? ? \ldots$
$\odot$ correct energies $\downarrow$
$\odot$ good operators $\boldsymbol{\checkmark}$

## Overview

## Repair work I: find $\mathrm{H}_{\text {renom }}$

© compute the physical mass (numerical renormalization)

Dynamics in terms of bare particles
(1) vacuum
(2) single particle
(3) two-particles (e- $\gamma$ and e-e scattering)

Repair work II: find $\mathrm{H}_{\text {dressed }}$
$\otimes^{*}$ construct physical operators

## Bare mass $m \neq$ physical mass $M$

$$
\begin{array}{lr}
\mathrm{H}_{0}=+\mathrm{dp} \mathrm{e}_{\mathrm{p}} \mathrm{~b}_{\mathrm{p}} \mathrm{~b}_{\mathrm{p}}++\mathrm{dk} \omega_{\mathrm{k}} \mathrm{a}_{\mathrm{k}} \mathrm{a}_{\mathrm{k}} & \text { where } \mathrm{e}_{\mathrm{p}}=\left[\mathrm{m}^{2} \mathrm{c}^{4}+\mathrm{c}^{2} \mathrm{p}^{2}\right]^{1 / 2} \\
\mathrm{H}_{\mathrm{int}}=++\mathrm{dp} \mathrm{dk} \mathrm{~g}(\mathrm{p}, \mathrm{k}) \mathrm{b}_{\mathrm{p}+\mathrm{k}} \mathrm{~b}_{\mathrm{p}}\left(\mathrm{a}_{\mathrm{k}}+\mathrm{a}_{-\mathrm{k}}\right)+\ldots & \mathrm{m}=\text { bare mass }
\end{array}
$$

Measurement: physical mass of an electron is $1 \mathrm{~kg}(=\mathrm{M})$ he problem: eigenvalue of H is $\#$ and not m and not 1 kg

$$
\left(\mathrm{H}_{0}+\mathrm{H}_{\text {int }}\right)|\mathrm{P}\rangle=\mathrm{E}_{\mathrm{P}}|\mathrm{P}\rangle \quad \mathrm{E}_{\mathrm{P}}=\left[\#^{2} \mathrm{c}^{4}+\mathrm{c}^{2} \mathrm{P}^{2}\right]^{1 / 2}
$$

The goal: choose $m$ such that \# is the physical mass $M$

Assume bare mass $m$ and compute physical mass $M$
$\mathrm{H}=+\mathrm{dp} \mathrm{e}_{\mathrm{p}} \mathrm{b}_{\mathrm{p}} \mathrm{b}_{\mathrm{p}}++\mathrm{dk} \omega_{\mathrm{k}} \mathrm{a}_{\mathrm{k}} \mathrm{a}_{\mathrm{k}}+++\mathrm{dpdk} \mathrm{g}(\mathrm{p}, \mathrm{k}) \mathrm{b}_{\mathrm{p}+\mathrm{k}} \mathrm{b}_{\mathrm{p}}\left(\mathrm{a}_{\mathrm{k}}+\mathrm{a}_{-\mathrm{k}}{ }^{\square}\right)+$
(1) use $e_{p}=\sqrt{ }\left(m^{2} c^{4}+c^{2} \mathrm{p}^{2}\right)$ with trial value: $m=1 \mathrm{~kg}$
(2) diagonalize $H$ to determine eigenvalue $E_{P}=\sqrt{ }\left(M^{2} c^{4}+c^{2} p^{2}\right)$ leading to mass $\mathrm{M}=0.7 \mathrm{~kg}$
repeat (1) and (2) with different trial bare mass $m$ until we obtain desired mass $M=1 \mathrm{~kg}$

## Complication:

eigenvalue $\mathrm{E}_{\mathrm{P}}$ depends on maximum momentum $\Lambda$ if $\Lambda \rightarrow \square$ then $\mathrm{M}->-\square$ (but we want $\mathrm{M}=1 \mathrm{~kg}$ )

Solution:

$$
\text { if } \Lambda \rightarrow \square \text { then } \mathrm{m} \rightarrow \square \text { (to keep } \mathrm{M}=1 \mathrm{~kg} \text { ) }
$$

QED with photon mass $\neq 0$ \& spin $=0 \Rightarrow$ scalar Yukawa

$$
\mathrm{H}_{\text {bare }}=\mathrm{H}_{0}+\lambda+\mathrm{dx} \psi(\mathrm{x}) \gamma^{0} \psi(\mathrm{x}) \phi(\mathrm{x})
$$

## Lowest energy eigenvalue

Renormalization of one-particle energies

$$
\Delta \mathrm{E}(\Lambda):=\mathrm{E}_{\text {num }}\left(\mathrm{m}_{\mathrm{e}}, \mathrm{~m}_{\gamma}, \Lambda\right)-\sqrt{ }\left(\mathrm{M}_{\text {phys }}{ }^{2} \mathrm{c}^{4}+\mathrm{c}^{2} \mathrm{p}^{2}\right)
$$

© find $\left(\mathrm{m}_{\mathrm{e}}, \mathrm{m}_{\gamma}\right)$ for $\mathrm{p}=0$ state to get $\mathrm{M}_{\text {phys }} \mathrm{c}^{2}$
$\odot\left(m_{e}, m_{\gamma}\right)$ works for all other $p$ to get $\sqrt{ }\left(M_{\text {phys }}{ }^{2} c^{4}+c^{2} p^{2}\right)$

## Renormalization of two-particle masses

$$
\Delta \mathrm{E}(\Lambda)=\mathrm{E}_{\text {num }}\left(\mathrm{m}_{\mathrm{e}}, \mathrm{~m}_{\gamma}, \Lambda\right)-2 \mathrm{M}_{\mathrm{phys}} \mathrm{c}^{2}
$$

© $\left(\mathrm{m}_{\mathrm{e}}, \mathrm{m}_{\gamma}\right)$ can repair entire spectrum
© 2-fermion bound state energy can now be analyzed
© non-perturbative exact numerical renormalization

## Beautiful special case: Greenberg-Schweber model

$$
\mathrm{H}_{\text {bare }}=\mathbf{E}_{\text {bare }} \Sigma_{\mathrm{p}} \mathrm{~b}_{\mathrm{p}} \mathrm{~b}_{\mathrm{p}}+\sum_{\mathrm{k}} \omega_{\mathrm{k}} \mathrm{a}_{\mathrm{k}} \mathrm{a}_{\mathrm{k}}-\lambda^{2} \sum_{\mathrm{p}} \Sigma_{\mathrm{k}}\left(2 \omega_{\mathrm{k}}\right)^{-1} \mathrm{~b}_{\mathrm{p}+\mathrm{k}} \mathrm{~b}_{\mathrm{p}}\left(\mathrm{a}_{\mathrm{k}}+\mathrm{a}_{-\mathrm{k}}\right)
$$

$$
\mathbf{B}_{\mathrm{p}}=\mathrm{U} \mathrm{~b}_{\mathrm{p}} \mathrm{U}
$$

$$
\text { with } \mathrm{U} \alpha \exp \left[\lambda \Sigma_{\mathrm{p}} \Sigma_{\mathrm{k}}\left(2 \omega_{\mathrm{k}}^{3}\right)^{-1 / 2} \mathrm{~b}_{\mathrm{p}+\mathrm{k}} \mathrm{~b}_{\mathrm{p}}\left(\mathrm{a}_{\mathrm{k}}-\mathrm{a}_{-\mathrm{k}}\right)\right]
$$

$$
\mathbf{A}_{\mathrm{k}}=\mathrm{U} \mathrm{a}_{\mathrm{k}} \mathrm{U}
$$

$$
\mathrm{H}_{\text {dress }}=\mathbf{E}_{\text {phys }} \sum_{\mathrm{p}} \mathrm{~B}_{\mathrm{p}} \mathrm{~B}_{\mathrm{p}}+\sum_{\mathrm{k}} \omega_{\mathrm{k}} \mathrm{~A}_{\mathrm{k}} \mathrm{~A}_{\mathrm{k}}-\lambda^{2} \sum_{\mathrm{p}} \sum_{\mathrm{q}} \sum_{\mathrm{k}}\left(2 \omega_{\mathrm{k}}^{2}\right)^{-1} \mathrm{~B}_{\mathrm{p}+\mathrm{k}} \mathrm{~B}_{\mathrm{q}} \mathrm{~B}_{\mathrm{p}} \mathrm{~B}_{\mathrm{q}+\mathrm{k}}
$$

$$
\mathrm{H}_{\text {bare }}
$$

$$
\mathbf{E}_{\text {bare }} \sum_{\mathrm{p}} \mathrm{~b}_{\mathrm{p}} \mathrm{~b}_{\mathrm{p}}+\sum_{\mathrm{k}} \omega_{\mathrm{k}} \mathrm{a}_{\mathrm{k}} \mathrm{a}_{\mathrm{k}}-\lambda^{2} \sum_{\mathrm{p}} \Sigma_{\mathrm{k}}\left(2 \omega_{\mathrm{k}}\right)^{-1} \mathrm{~b}_{\mathrm{p}+\mathrm{k}} \mathrm{~b}_{\mathrm{p}}\left(\mathrm{a}_{\mathrm{k}}+\mathrm{a}_{-\mathrm{k}}\right)
$$

$$
\begin{gathered}
\mathrm{H}_{\text {dress }}^{=} \\
\mathbf{E}_{\text {phys }} \Sigma_{\mathrm{p}} \mathrm{~B}_{\mathrm{p}} \mathrm{~B}_{\mathrm{p}}+\Sigma_{\mathrm{k}} \omega_{\mathrm{k}} \mathrm{~A}_{\mathrm{k}} \square \mathrm{~A}_{\mathrm{k}}-\lambda^{2} \sum_{\mathrm{p}} \Sigma_{\mathrm{q}} \Sigma_{\mathrm{k}}\left(2 \omega_{\mathrm{k}}^{2}\right)^{-1} \mathrm{~B}_{\mathrm{p}+\mathrm{k}} \mathrm{~B}_{\mathrm{q}} \square \mathrm{~B}_{\mathrm{p}} \mathrm{~B}_{\mathrm{q}+\mathrm{k}}
\end{gathered}
$$

physical energy $\mathrm{E}_{\text {phys }}=\mathrm{E}_{\text {bare }}-\lambda^{2} \Sigma_{\mathrm{k}}\left(2 \omega_{\mathrm{k}}^{2}\right)^{-1}$
$\square \mathrm{B}_{\mathrm{P}} \square|0\rangle$ is eigenstate of H , as $\mathrm{H}_{\mathrm{P}} \square|0\rangle=\mathrm{E}_{\mathrm{P}} \mathrm{B}_{\mathrm{P}} \square|0\rangle$
$\square$ no force intermediating virtual photons (no $\mathrm{e}^{-}-\gamma$ interaction)
new $\mathrm{e}^{-}-\mathrm{e}^{-}$interaction: $\mathrm{e}^{-}(\mathrm{q}+\mathrm{k})+\mathrm{e}^{-}(\mathrm{p})-->\mathrm{e}^{-}(\mathrm{q})+\mathrm{e}^{-}(\mathrm{p}+\mathrm{k})$

The construction of the dressed particle Hamiltonian
$\mathrm{H}_{\text {dressed }}=+\mathrm{dp} \mathrm{e} \mathrm{e}_{\mathrm{p}} \mathrm{B}_{\mathrm{p}} \mathrm{B}_{\mathrm{p}}++\mathrm{dp} \mathrm{e}_{\mathrm{p}} \mathrm{D}_{\mathrm{p}}^{\square} \mathrm{D}_{\mathrm{p}}++\mathrm{dp} \omega_{\mathrm{p}} \mathrm{A}_{\mathrm{p}}^{\square} \mathrm{A}_{\mathrm{p}}+\mathrm{V}$
$\mathrm{V}=+++++\alpha\left(\mathrm{p}, \mathrm{q}, \mathrm{p}^{\prime}, \mathrm{q}^{\prime}\right) \mathrm{B}_{\mathrm{p}}{ }^{\square} \mathrm{B}_{\mathrm{q}}{ }^{\square} \mathrm{B}_{\mathrm{p}}, \mathrm{B}_{\mathrm{q}}$,
interaction)
$++++++\beta\left(\mathrm{p}, \mathrm{q}, \mathrm{p}^{\prime}, \mathrm{q}^{\prime}\right) \mathrm{B}_{\mathrm{p}}{ }^{\square} \mathrm{D}_{\mathrm{q}}{ }^{\square} \mathrm{B}_{\mathrm{p}}, \mathrm{D}_{\mathrm{q}}$,
( $\mathrm{e}^{-}-\mathrm{e}^{+}$interaction)
$+++++++\gamma\left(\mathrm{p}, \mathrm{q}, \mathrm{p}^{\prime}, \mathrm{q}^{\prime}, \mathrm{q}^{\prime}{ }^{\prime}\right) \mathrm{B}_{\mathrm{p}}{ }^{\square} \mathrm{B}_{\mathrm{q}}{ }^{\square} \mathrm{B}_{\mathrm{p}}, \mathrm{B}_{\mathrm{q}^{\prime}} \mathrm{A}_{\mathrm{q}^{\prime}}$,
( $\mathrm{e}^{-}-\gamma$ interaction
$+\ldots$
(1) use $\mathrm{H}_{\text {renorm }}$ to compute scattering matrix S
(2) find $\alpha, \beta, \gamma$ etc. to match $S$

Example: dressed particle Hamiltonian for scalar Yukawa system

$$
\begin{gathered}
\mathrm{H}_{\text {bare }}=\mathrm{H}_{0}+\lambda+\mathrm{dx} \psi(\mathrm{x}) \gamma^{0} \psi(\mathrm{x}) \phi(\mathrm{x}) \\
\mathrm{V}_{\mathrm{e}--\mathrm{e}-}=+++++\alpha\left(\mathrm{p}, \mathrm{q}, \mathrm{p}^{\prime}, \mathrm{q}^{\prime}\right) \mathrm{B}_{\mathrm{p}}{ }^{\square} \mathrm{B}_{\mathrm{q}}{ }^{\square} \mathrm{B}_{\mathrm{p}^{\prime}} \mathrm{B}_{\mathrm{q}^{\prime}} \\
\alpha\left(\mathrm{p}, \mathrm{q}, \mathrm{p}^{\prime}, \mathrm{q}^{\prime}\right) \sim \delta\left(\mathrm{p}+\mathrm{q}-\mathrm{p}^{\prime}-\mathrm{q}^{\prime}\right) /\left[\left(\mathrm{q}-\mathrm{q}^{\prime}\right)^{2}+\mathrm{M}^{2} \mathrm{c}^{2}\right]
\end{gathered}
$$

$\square+d x \exp \left[i\left(q-q^{\prime}\right) x\right] \alpha\left(p, q, p^{\prime}, q^{\prime}\right) \sim \exp (-M|x|)$
$\square$ direct interpretation possible

## Summary

- Goal: visualization of QED processes
- Main tool: computational quantum field theory
- First progress: $\mathrm{H}_{\text {bare }}$--> $\mathrm{H}_{\text {renorm }}$
- Early stage progress: $\mathrm{H}_{\text {renorm }}-->\mathrm{H}_{\text {dressed }}$
- many conceptual and computational challenges ...
