$$\begin{aligned}
\partial_t \tilde{h} = & \sum_r \left[-\gamma_r^+(w) \tilde{h}(\mathbf{w}) + \gamma_r^+(w+1) \tilde{h}(\mathbf{w} + \mathbf{e}_r) \right] + \\
& \left[-\gamma_r^-(w) \tilde{h}(\mathbf{w}) + \gamma_r^-(w-1) \tilde{h}(\mathbf{w} - \mathbf{e}_r) \right] \\
& + \sum_{\langle rr' \rangle} \left[-\gamma_b^+(w_r, w_{r'}) \tilde{h}(\mathbf{w}) + \gamma_b^+(w_r+1, w_{r'}) \tilde{h}(\mathbf{w} + \mathbf{e}_r) \right] \\
& + \left[-\gamma_b^-(w_r, w_{r'}) \tilde{h}(\mathbf{w}) + \gamma_b^-(w_r-1, w_{r'}) \tilde{h}(\mathbf{w} - \mathbf{e}_r) \right] \\
& + [r \longleftrightarrow r']
\end{aligned}$$

$$\gamma_r^+(w) = \frac{1}{N-1} w(w-1), \quad \gamma_r^-(w) = \frac{1}{N-1} 3(N-w)w$$

$$\gamma_b^+(w_1, w_2) = \frac{g^2}{2N} w_1 w_2, \quad \gamma_b^-(w_1, w_2) = \frac{g^2}{2N} 3(N-w_1)w_2.$$

strength of perturbation at a fixed time

spacetime contours of constant strength

Two related questions:

(1) How do we measure this effect?

(2) How does it manifest in physical properties?

Measuring Quantum Chaos

PHYSICS TODAY

Reverse!

Fig. 6. Multiple exposures of single proton echoes. The first rf pulse occurs at the beginning of the trace and the second pulse is spaced from the origin at equal intervals for each exposure with the sample at thermal equilibrium. The echo envelope provides a measure of the phase coherence parameter T_2 .

Outlook

- Today we discussed the quantum butterfly effect and its various manifestations in different physical systems
- This is just the tip of the iceberg: quantum chaos has a long history, and there are many new ideas and experiments to explore
- Thank you to my collaborators: Greg Bentsen, Monika Schleier-Smith, Patrick Hayden, Shenglong Xu, Nicole Yunger-Halpern, Subhayan Sahu, Masaki Tezuka, Masanori Hanada, Hrant Gharibyan, Debanjan Chowdhury, Aavishkar Patel, Subir Sachdev, Gong Cheng, Julia Steinberg, Andrew Guo, Dan Roberts, Norm Yao, Fabian Grusdt, Misha Lukin, Dan Stamper-Kurn, Joel Moore, Eugene Demler, Xiao Li, Yi-Ting Hsu, Sankar Das Sarma, ...

THANK YOU!
