

Observations of Complex Flaring Topologies

Ed DeLuca
SAO

Outline

- TRACE Flare Observations
 - The web page
 - Data sets
 - UV & EUV data
- Good Flare: 1998 Bastille Day
- Bad Flare: 1998 Sep 23
- Modeling Requirements

Flare Observations

Finding useful multi-mission data sets is difficult. The TRACE flare catalogue is available on the web for your one-stop flare shopping needs.

To date TRACE has seen:
 29 X-flares
 224 M-flares
 177 C-flares

Web Page:
<http://hea-www.harvard.edu/SSXG/kathy/flares/flares.html>

Data Sets

- Alignment of TRACE Images
 - UV - EUV Align the series of UV and EUV images separately. Then use known offsets to align UV & EUV images.
 - UV data shows magnetic structures in the chromosphere that can be aligned with magnetogram

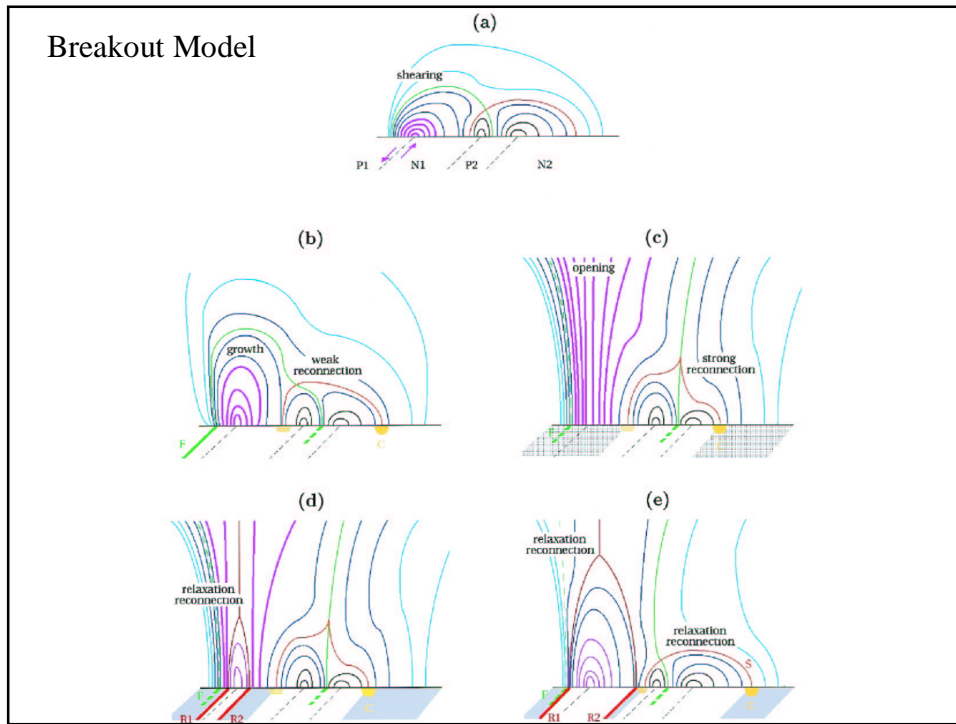

Bastille Day 1998

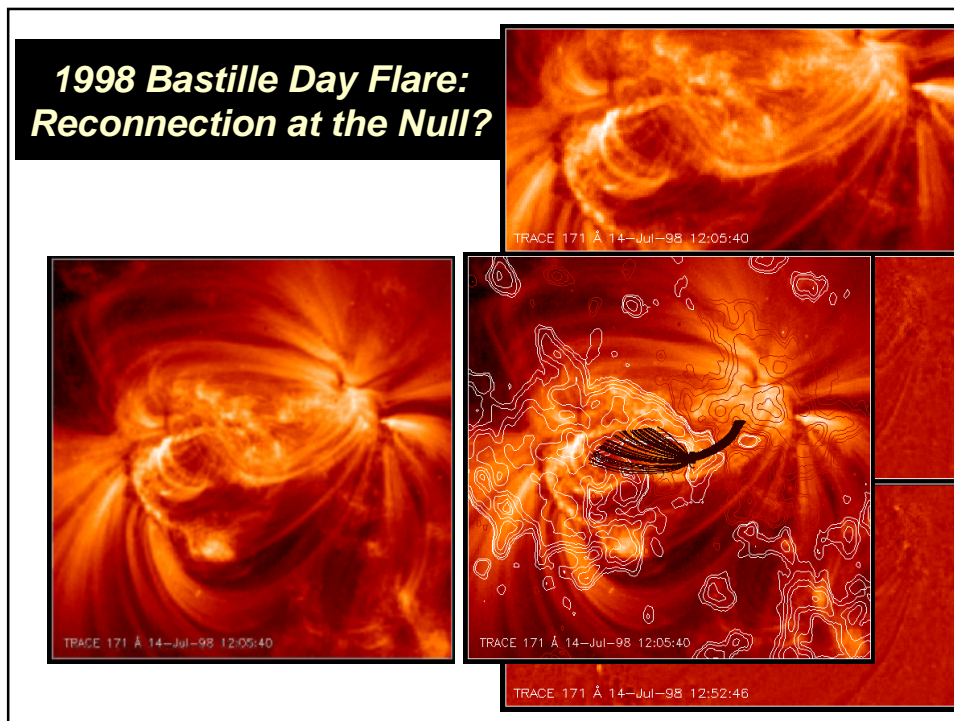

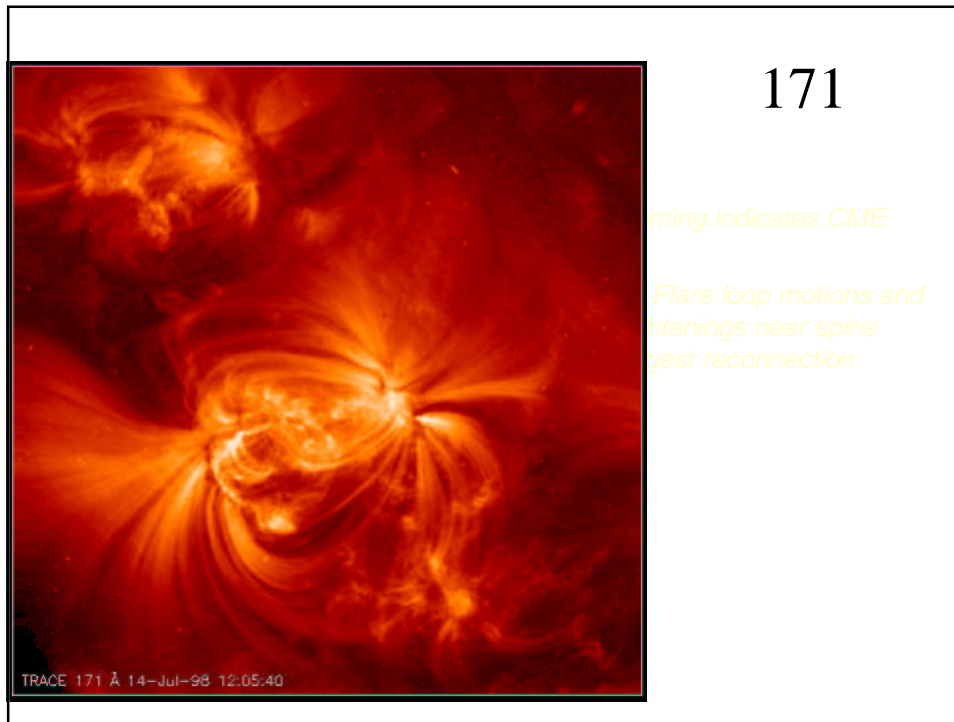

- 12:59 UT M4.6, AR 8270, δ -spot
- SOHO out of contact
- SXT observed the decay only

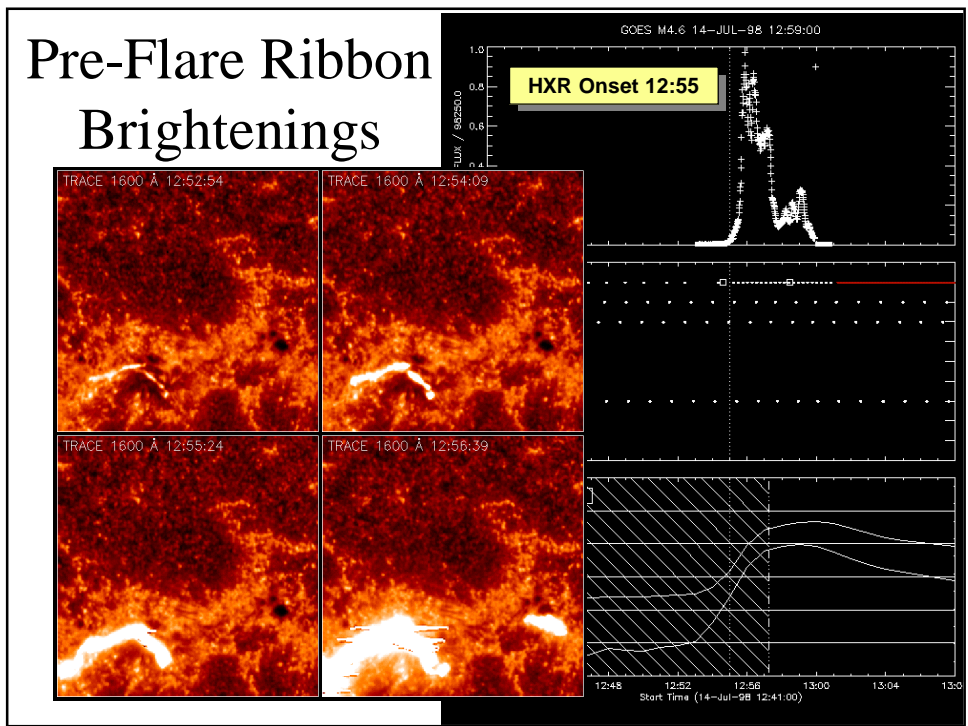

- First observation of oscillation coronal loops
- Interesting pre-flare dynamics that strongly support the “Breakout Model”

Conclusions

- A combination of high resolution coronal observations, chromospheric observations and photospheric magnetic fields are needed to map the topology of flares.
- We need much better models of coronal magnetic fields and systematic ways of choosing models that are consistent with the observations.
- Multi-thermal observations can be used to map connectivity in more detail.

Modeling Requirements

- Ability to embed local high resolution (vector) magnetic field data with hemisphere line-of-sight observations and synoptic full sphere data.
- Simple force free models that can be fit to different types of observations:
 - coronal connectivity
 - chromospheric brightening
 - filaments channels
- 3-D MHD with plasma and RT
